### **Persistence and degradability**

In an aerobic aqueous screening test, 1-chlorooctane at 100 mg/l was incubated with a sludge inoculum; 74-81% of the theoretical BOD was measured at 4 weeks(1). 1-Chlorooctane at 1 mg/l was readily biodegraded by a sludge inoculum with the utilization of 900 µg/L oxygen within 1.7 days; complete degradation was reported in 3 days with the formation of a metabolite containing a carbonyl oxygen(2). A pure culture of *Corynebacterium* sp. was shown to degrade 1-chlorooctane(3).

### **Bioaccumulative potential**

An estimated BCF value of 2300 was calculated for 1-chlorooctane(SRC), using a measured log Kow of 4.73(1) and a recommended regression-derived equation(2). According to a classification scheme(3), this BCF value suggests that bioconcentration in aquatic organisms is very high(SRC).

### **Mobility in soil**

The Koc of 1-chlorooctane is estimated as approximately 8900(SRC), using a measured log Kow of 4.73(1) and a regression-derived equation(2,SRC). According to a recommended classification scheme(3), this estimated Koc value suggests that 1-chlorooctane will be immobile in soil(SRC).

### **Other adverse effects**

no data available

## **SECTION 13: Disposal considerations**

### **Disposal methods**

#### **Product**

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

### **Contaminated packaging**

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
