Persistence and degradability

AEROBIC: 1-Naphthaleneacetic acid, present at 30 mg/l, reached 0% of its theoretical BOD in 2 weeks using an activated sludge inoculum at 100 mg/l and the Japanese MITI test(1). 1-Naphthaleneacetic acid has a reported half-life in soil of 10 days, attributed to microbial degradation(2).

Bioaccumulative potential

BCFs of 0.15-0.59 and <1.7-4.2 were measured in carp (*Cyprinus carpio*) for 1-naphthaleneacetic acid at test chemical concns of 0.5 and 0.05 mg/l, respectively(1). According to a classification scheme(2), these BCFs suggest the potential for bioconcentration in aquatic organisms is low(SRC).

Mobility in soil

The Koc of 1-naphthaleneacetic acid is estimated as 390(SRC), using a log Kow of 2.24(1) and a regression-derived equation(2). According to a classification scheme(3), this estimated Koc value suggests that 1-naphthaleneacetic acid is expected to have moderate mobility in soil. The pKa of 1-naphthaleneacetic acid is 4.23(4), indicating that this compound will primarily exist in the dissociated form in the environment and anions generally have greater mobility than their neutral counterparts(5).

Other adverse effects

no data available

SECTION 13: Disposal considerations

Disposal methods

Product

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

Contaminated packaging

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
