### **Bioaccumulative potential**

Whole body BCF values of 21, 22, and 13, were measured for clams, fathead minnows, and tadpoles, respectively, under flow-through conditions over a 7-day period, for a structurally-similar compound, cetylpyridinium bromide(1). An estimated BCF of 2 was calculated for cetylpyridinium chloride(SRC), using a log Kow of 1.71(2) and a regression-derived equation(3). According to a classification scheme(4), these BCF values suggest the potential for bioconcentration in aquatic organisms is low(SRC).

### **Mobility in soil**

The Koc of cetylpyridinium chloride is estimated as 200(SRC), using a measured log Kow of 1.71(1) and a regression-derived equation(2). According to a classification scheme(3), this estimated Koc value suggests that cetylpyridinium chloride is expected to have moderate mobility in soil. However, quaternary ammonium compounds are known to sorb strongly, and rapidly in well-mixed systems, to a wide variety of materials (such as sewage sludge, sediment, clay)(4) and the mobility of cetylpyridinium chloride in soil may be considerably less than estimated(SRC).

### **Other adverse effects**

no data available

## **SECTION 13: Disposal considerations**

### **Disposal methods**

#### **Product**

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

#### **Contaminated packaging**

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
